

# ADSORPTION DRYER

## MOC-DRY

(Refrigeration + Adsorption Dryer)

### DESCRIPTION

MOC-Dry dryers have been designed for continuous separation of water vapour from compressed air thus reducing dew point. Drying consist of two steps. Refrigeration dryer first eliminates most of the water from air and reduces dew point down to PDP +3°C. Further reduction of dew point is achieved by adsorption dryer. Operation of dryer is simpler compared to conventional heat regenerated adsorption dryer while average compressed air losses are only up to 4,6%.

### DRYER RATING ACCORDING TO ISO8573-1

| Solid particles <sup>(1)</sup> | Water <sup>(1),(2)</sup> | Oil <sup>(1)</sup> |
|--------------------------------|--------------------------|--------------------|
| 2                              | 1-3                      | 1                  |

<sup>(1)</sup>Typical result based on standard configuration and nominal operating conditions

<sup>(2)</sup>Depend on specific design. Class 2 when operated at nominal operating conditions.

### TECHNICAL SPECIFICATIONS

|                                    |   |
|------------------------------------|---|
| Operating pressure                 | 4 - 14 bar  |
| Operating temperature              | 1,5°C to 45°C   |
| Pressure dew points                | Down to -40°C   |
| Voltage, Frequency                 | 230V and 3x400V depending on size; 50 Hz  |
| Protection class (controller)      | IP 65   |
| Filter (inlet) <sup>(3)</sup>      | Super fine coalescing; residual oil cont. <0,01mg/m3; 0,01µm                        |
| Filter (outlet)                    | Dust filter; 1µm  |
| Average purge air consumption      | Approx. 4,6% (at nominal inlet conditions, Outlet PDP -40) <sup>(4)</sup>           |
| Dew point dependent control        | OPTIONAL, Only available when dew point sensor is connected!                        |
| Relay output for dew point warning | OPTIONAL, Only available when dew point sensor is connected!                        |
| Digital input for stand-by         | STANDARD, Open contact 24 VDC   |
| Communication                      | ON REQUEST, TCP/IP with Siemens LOGO! and Siemens SIMATIC devices, LOGO! Web server |

(3) If dryer is supplied without inlet filter compressed air class 1 (ISO 8753-1) for solid particles and oil should be provided to the inlet of the dryer.

(4) Purge air consumption is related with inlet temperature to the adsorption dryer (outlet temperature from refrigeration dryer). Typically inlet temperature to adsorption dryer is 10°C lower than inlet temperature to refrigeration dryer. In case inlet temperature to refrigeration dryer is lower than 35°C demand for purge air increases.

### MATERIALS

| Heat exchanger                           | Stainless steel                            |
|--|--|
| Columns, construction, support           | Steel                                      |
| Column inner protection                  | /  |
| Column and construction outer protection | Epoxy painted                              |
| Desiccant support screen                 | Stainless steel                            |
| Valves                                   | Brass, aluminium                           |
| Sealings                                 | NBR  |
| Fittings, Screws, plugs                  | INOX, brass, steel (zinc plated)           |
| Lubricant                                | Shell cassida grease RLS 2                 |
| Outside protection                       | Powder paint coated (Epoxy-polyester base) |
| Desiccant                                | 80% Molecular sieve 4A, 20% Silica gel     |

<sup>(3)</sup>Refers to 1bar(a) and 20°C at 7 bar operating pressure , inlet temperature 35°C and pressure dew point at outlet -40°C

<sup>(4)</sup>Outlet flow refers to typical assumption during regeneration phase for operating at nominal inlet flow conditions. Outlet flow includes average air losses of approximately 4,6 %. Maximum purge air flow during regeneration phase is up to 5,7% of nominal inlet conditions. <sup>(5)</sup>Refers to inlet and outlet filter housing.

**CORRECTION FACTORS**

To calculate the correct capacity of a given filter based on actual operating conditions, multiply the nominal flow capacity by the appropriate correction factor(s). CORRECTED CAPACITY = NOMINAL FLOW CAPACITY x C<sub>OP</sub> x C<sub>IT</sub> x C<sub>AT</sub> x C<sub>D</sub>
